ABSTRACT

Techniques are provided for wireless sensor alerts. In certain implementations, wireless sensor alerts may be facilitated by a process at a wireless device. The process may include detecting a signal representing an environmental state in the vicinity of the wireless

5   device, comparing the environmental state represented by the signal against a set of remotely programmable rules at the wireless device, and, if the environmental state satisfies at least one of the rules, generating a communication for transmission to a wireless network based on the satisfied rule.
